Converting Legacy CTI and XML InputⁱFiles to YAML

Cantera comes with a converter utility `cti2yaml` (or `cti2yaml.py`) that **converts legacy CTI format mechanisms into the new YAML format** introduced in Cantera 2.5. [Read more](#)

AI Overview

+4

Cantera mechanisms in legacy Chemkin (`.inp`, `.txt`) format are converted to the modern YAML format using the `ck2yaml` utility, typically run from the terminal or via Python. The command `ck2yaml --input=chem.inp --thermo=thermo.dat --transport=tran.dat` generates a `chem.yaml` file, often requiring `--permissive` for duplicate data. 🧪 Cantera.org +1

Converting Chemkin to YAML (`.inp` to `.yaml`) [🔗]

The primary tool for converting Chemkin-format reaction mechanisms is `ck2yaml`. [🔗]

- **Basic Command:**

```
bash
```

```
ck2yaml --input=mech.inp --thermo=thermo.dat --transport=tran.dat
```

- **With Python:**

```
python
```

```
import cantera as ct
# This runs the command-line tool within Python
!python -m cantera.ck2yaml --input=mech.inp --thermo=thermo.dat
```

- **Handling Errors (`--permissive`):** If the mechanism has duplicate species or thermo data, use the `--permissive` flag to bypass validation errors.

```
bash
```

Converting Legacy CTI/XML to YAML

If your file is an older Cantera `.cti` or `.xml` file, use `cti2yaml`. Cantera.org

bash

```
cti2yaml legacy_file.cti
# Generates legacy_file.yaml
```

Key Considerations

- **Output Filename:** By default, the output file will have the same name as the input file but with a `.yaml` extension.
- **Surface Mechanisms:** Use the `--surface` flag if you have a separate file for surface reactions.
- **Validation:** `ck2yaml` automatically attempts to import the resulting YAML file to check for errors. Cantera.org +2

Introduction to YAML Input Files

Cantera YAML files consist of individual values, which may be strings, numbers or booleans, that are then composed as elements of nested mappings and sequences. [Read more](#)
